

The structures of Riktig

Every class in theories/Structure/ – carriers, operations with their types, and laws – as Coq states them, generated by scripts/structures-md.py

Magma (M)

```
ops: add (+) : M → M → M
• equivalence: Equivalence equ
• op_proper: Proper (equ ==> equ ==> equ) add
```

Semigroup (S) extends Magma

```
ops: add (+) : S → S → S
• is_associative: ∀ a b x : S, a + b + x == a + (b + x)
```

Monoid (M) extends Semigroup

```
ops: zero (0) : M, add (+) : M → M → M
• is_left_identity: ∀ x : M, 0 + x == x
• is_right_identity: ∀ x : M, x + 0 == x
```

Group (G) extends Monoid

```
ops: zero (0) : G, add (+) : G → G → G, neg (- x) : G → G
• neg_proper: Proper (equ ==> equ) neg
• is_left_inverse: ∀ a : G, - a + a == 0
• is_right_inverse: ∀ a : G, a - a == 0
```

AbGroup (A) extends Group

```
ops: zero (0) : A, add (+) : A → A → A, neg (- x) : A → A
• is_commutative: ∀ a b : A, a + b == b + a
```

Semiring (R) extends Monoid (add_monoid), Monoid (mul_monoid)

```
ops: zero (0) : R, add (+) : R → R → R, one (1) : R, mult (*) : R → R → R
• add_commutative: ∀ a b : R, a + b == b + a
• is_left_distributive: ∀ a x y : R, a * (x + y) == a * x + a * y
• is_right_distributive: ∀ x y b : R, (x + y) * b == x * b + y * b
• mul_zero_left: ∀ x : R, 0 * x == 0
• mul_zero_right: ∀ x : R, x * 0 == 0
```

CommSemiring (R) extends Semiring

```
ops: zero (0) : R, add (+) : R → R → R, one (1) : R, mult (*) : R → R → R
• mul_commutative: ∀ a b : R, a * b == b * a
```

Peano (N)

```
ops: zero (0) : N, succ : N → N
• equivalence: Equivalence equ
• succ_proper: Proper (equ ==> equ) succ
• succ_injective: ∀ a b : N, succ a == succ b → a == b
• succ_not_zero: ∀ n : N, succ n != 0
• nat_induction: ∀ P : N → Prop, Proper (equ ==> iff) P → P 0 → (∀ n : N, P n → P (succ n)) → ∀ n : N, P n
```

PeanoArith (N) extends Peano

```
ops: zero (0) : N, succ : N → N, one (1) : N, add (+) : N → N → N, mult (*) : N → N → N
• add_proper: Proper (equ ==> equ ==> equ) add
• mul_proper: Proper (equ ==> equ ==> equ) mult
• one_succ: (1 : N) == succ 0
• add_zero: ∀ a : N, a + 0 == a
• add_succ: ∀ a b : N, a + succ b == succ (a + b)
• mul_zero: ∀ a : N, a * 0 == 0
• mul_succ: ∀ a b : N, a * succ b == a * b + a
```

Naturals (N) extends Peano, CommSemiring

```
ops: zero (0) : N, succ : N → N, one (1) : N, add (+) : N → N → N, mult (*) : N → N → N
• succ_add: ∀ n : N, succ n == n + 1
```

NatOrder (N) over Naturals N

```
ops: le (<=) : N → N → Prop
• le_proper: Proper (equ ==> equ ==> iff) le
• le_add: ∀ a b : N, a <= b ↔ exists c : N, a + c == b
```

NatRec (N) over Peano N

```
ops: natrec : ∀ A : Type, A → (N → A → A) → N → A
• natrec_proper: ∀ (A : Type) (eA : EqRel A) (EA : Equivalence eA) (a : A) (f : N → A → A), Proper (equ ==> equ ==> equ) f → Proper (equ ==> equ) (natrec A a f)
• natrec_zero: ∀ (A : Type) (eA : EqRel A) (EA : Equivalence eA) (a : A) (f : N → A → A), natrec A a f 0 == a
• natrec_succ: ∀ (A : Type) (eA : EqRel A) (EA : Equivalence eA) (a : A) (f : N → A → A) (n : N), natrec A a f (succ n) == f n (natrec A a f n)
```

Finite (I N) over NatOrder N

ops: card : N, index : I → N, elem : N → I

- equivalence: Equivalence equ
- index_proper: Proper (equ ==> equ) index
- elem_proper: Proper (equ ==> equ) elem
- index_lt: $\forall i : I, \text{index } i < \text{card}$
- elem_index: $\forall i : I, \text{elem } (\text{index } i) == i$
- index_elem: $\forall k : N, k < \text{card} \rightarrow \text{index } (\text{elem } k) == k$

Table (I A T)

ops: get : T → I → A, tabulate : (I → A) → T

- equivalence: Equivalence equ
- get_proper: Proper (equ ==> equ) get
- tabulate_proper: Proper (pointwise_relation I equ ==> equ) tabulate
- get_tabulate: $\forall (f : I \rightarrow A) (i : I), \text{get } (\text{tabulate } f) i == f i$
- tabulate_get: $\forall t : T, \text{tabulate } (\text{get } t) == t$

Equiv (A B)

ops: to : A → B, from : B → A

- to_proper: Proper (equ ==> equ) to
- from_proper: Proper (equ ==> equ) from
- from_to: $\forall a : A, \text{from } (\text{to } a) == a$
- to_from: $\forall b : B, \text{to } (\text{from } b) == b$

EquDec (A)

• equ_dec: $\forall a b : A, \text{Decidable } (a == b)$

LtDec (A)

• lt_dec: $\forall a b : A, \text{Decidable } (a < b)$

LeDec (A)

• le_dec: $\forall a b : A, \text{Decidable } (a \leq b)$

BigOp (I A T) over Monoid A, Table I A T get tabulate

ops: bigop : T → A

- bigop_proper: Proper (equ ==> equ) bigop
- bigop_zero: $\text{bigop } (\text{tabulate } (\lambda _ \Rightarrow 0)) == 0$
- bigop_add: $\forall s t : T, \text{bigop } (\text{tabulate } (\lambda i \Rightarrow \text{get } s i + \text{get } t i)) == \text{bigop } s + \text{bigop } t$
- bigop_single: $\forall (t : T) (i : I) (a : A), \text{get } t i == a \rightarrow (\forall j : I, j \neq i \rightarrow \text{get } t j == 0) \rightarrow \text{bigop } t == a$

Ring (R) extends AbGroup, Monoid

ops: zero (0) : R, add (+) : R → R → R, neg (- x) : R → R, one (1) : R, mult (*) : R → R → R

- is_left_distributive: $\forall a x y : R, a * (x + y) == a * x + a * y$
- is_right_distributive: $\forall x y b : R, (x + y) * b == x * b + y * b$

RingHom (A B)

ops: h : A → B

- hom_proper: Proper (equ ==> equ) h
- hom_additive: $\forall x y : A, h (x + y) == h x + h y$
- hom_multiplicative: $\forall x y : A, h (x * y) == h x * h y$
- hom_one: $h 1 == (1 : B)$

Field (F) extends Ring

ops: zero (0) : F, add (+) : F → F → F, neg (- x) : F → F, one (1) : F, mult (*) : F → F → F, inv : F → F

- inv_proper: Proper (equ ==> equ) inv
- is_mul_commutative: $\forall a b : F, a * b == b * a$
- is_mul_left_inverse: $\forall a : F, \text{nonzero } F a \rightarrow \text{inv } a * a == 1$
- nontrivial: $(1 : F) \neq 0$

MinusOneNotASquare (F) over Field F

• two_squares_vanish: $\forall a b : F, a * a + b * b == 0 \rightarrow a == 0$

ScaleLaws (F V) over Field F

ops: add (+) : V → V → V, scale (*) : F → V → V

- scale_proper: Proper (equ ==> equ ==> equ) scale
- is_left_distributive: $\forall (a : F) (x y : V), a * (x + y) == a * x + a * y$
- is_right_distributive: $\forall (x y : F) (b : V), (x + y) * b == x * b + y * b$
- is_associative: $\forall (a b : F) (x : V), (a * b) * x == a * (b * x)$
- is_left_identity: $\forall x : V, 1 * x == x$

VectorSpace (F V) over Field F extends AbGroup, ScaleLaws

ops: zero (0) : V, add (+) : V → V → V, neg (- x) : V → V, scale (*) : F → V → V

Linear (F U V)

ops: f : U → V

- proper: Proper (equ ==> equ) f
- is_additive: $\forall x y : U, f (x + y) == f x + f y$
- is_homogeneous: $\forall (a : F) (x : U), f (a * x) == a * f x$

InnerProductSpace (F V) over VectorSpace F V

• inner_proper: Proper (equ ==> equ ==> equ) (@inner F V _)

- inner_additive: $\forall v : V, \text{Additive } V F \text{ add add } (\lambda u \Rightarrow \langle u, v \rangle)$
- inner_homogeneous: $\forall v : V, \text{Homogeneous } F V F \text{ mult } (\lambda a \Rightarrow a) (\lambda u \Rightarrow \langle u, v \rangle)$
- is_commutative: $\forall a b : V, \langle a, b \rangle == \langle b, a \rangle$

Integers (Z) extends Ring

ops: zero (0) : Z, add (+) : Z → Z → Z, neg (- x) : Z → Z, one (1) : Z, mult (*) : Z → Z → Z
 • mul_commutative: ∀ a b : Z, a * b == b * a
 • int_induction: ∀ P : Z → Prop, Proper (equ ==> iff) P → P 0 → (∀ z : Z, P z → P (z + 1)) → (∀ z : Z, P z → P (z + - (1 : Z))) → ∀ z : Z, P z

Rationals (Q Z) over Field Q, Integers Z extends RingHom

ops: cast : Z → Q
 • cast_injective: ∀ a b : Z, cast a == cast b → a == b
 • is_fraction: ∀ q : Q, exists a b : Z, cast b != 0 /\ q * cast b == cast a

OrderedField (F) over Field F

ops: le (<=) : F → F → Prop, abs : F → F
 • le_proper: Proper (equ ==> equ ==> iff) le
 • abs_proper: Proper (equ ==> equ) abs
 • le_reflexive: Reflexive le
 • le_transitive: Transitive le
 • le_antisymmetric: Antisymmetric F equ le
 • le_total: ∀ a b : F, a <= b \/ b <= a
 • le_stable: ∀ a b : F, ~ ~ a <= b → a <= b
 • add_le_mono_l: ∀ a b c : F, a <= b → c + a <= c + b
 • mul_nonneg: ∀ a b : F, 0 <= a → 0 <= b → 0 <= a * b
 • abs_of_nonneg: ∀ a : F, 0 <= a → abs a == a
 • abs_neg: ∀ a : F, abs (- a) == abs a

Reals (R) over OrderedField R

• complete: ∀ P : Pred R, (exists x : R, P x) → (exists b : R, ∀ x : R, P x → x <= b) → exists s : R, (∀ x : R, P x → x <= s) /\ (∀ b : R, (∀ x : R, P x → x <= b) → s <= b)

ApproxSqrt (F) over OrderedField F

ops: approx_sqrt : F → F → F
 • approx_sqrt_nonneg: ∀ x eps : F, 0 <= approx_sqrt x eps
 • approx_sqrt_le: ∀ x eps : F, 0 <= x → 0 < eps → approx_sqrt x eps * approx_sqrt x eps <= x
 • approx_sqrt_close: ∀ x eps : F, 0 <= x → 0 < eps → x <= (approx_sqrt x eps + eps) * (approx_sqrt x eps + eps)

ConstructiveReals (R Q N) over Ring R, Commutative R R mult, OrderedField Q, NatOrder N extends RingHom

ops: lt (<) : R → R → Set, inv_apart : ∀ x : R, lt x 0 + lt 0 x → R, abs : R → R, approx : R → Q → Q, cast : Q → R
 • lt_asym: ∀ x y : R, x < y → y < x → False
 • lt_trans: ∀ x y z : R, x < y → y < z → x < z
 • lt_cotrans: ∀ x y z : R, x < z → ((x < y) + (y < z))%type
 • lt_equ_l: ∀ x x' y : R, x == x' → x < y → x' < y
 • lt_equ_r: ∀ x y y' : R, y == y' → x < y → x < y'
 • equ_of_le: ∀ x y : R, x ≤ y → y ≤ x → x == y
 • cast_lt: ∀ q r : Q, q < r → cast q < cast r
 • lt_cast: ∀ q r : Q, cast q < cast r → q < r
 • zero_lt_one: (0 : R) < 1
 • add_lt_mono_l: ∀ x y z : R, y < z → x + y < x + z
 • add_lt_reg_l: ∀ x y z : R, x + y < x + z → y < z
 • mul_pos: ∀ x y : R, 0 < x → 0 < y → 0 < x * y
 • mul_le_mono_l: ∀ c x y : R, 0 ≤ c → x ≤ y → c * x ≤ c * y
 • inv_l: ∀ (x : R) (Hx : ((x < 0) + (0 < x))%type), inv_apart x Hx * x == 1
 • inv_pos: ∀ (x : R) (Hx : ((x < 0) + (0 < x))%type), 0 < x → 0 < inv_apart x Hx
 • dense: ∀ x y : R, x < y → {q : Q & ((x < cast q) * (cast q < y))%type}
 • archimedean: ∀ x : R, {q : Q & x < cast q}
 • abs_proper: Proper (equ ==> equ) abs
 • abs_le_iff: ∀ x y : R, (x ≤ y /\ - x ≤ y) ↔ abs x ≤ y
 • abs_mul: ∀ x y : R, abs (x * y) == abs x * abs y
 • approx_close: ∀ (x : R) (eps : Q), 0 < eps → abs (x + - cast (approx x eps)) ≤ cast eps
 • complete: ∀ u : N → R, (∀ eps : Q, 0 < eps → {n : N & ∀ i j : N, n ≤ i → n ≤ j → abs (u i + - u j) ≤ cast eps}) → {l : R & ∀ eps : Q, 0 < eps → {n : N & ∀ i : N, n ≤ i → abs (u i + - l) ≤ cast eps}}

Trig (R) over Ring R, Commutative R R mult

ops: sin : R → R, cos : R → R
 • sin_proper: Proper (equ ==> equ) sin
 • cos_proper: Proper (equ ==> equ) cos
 • sin_zero: sin 0 == 0
 • cos_zero: cos 0 == 1
 • sin_add: ∀ a b : R, sin (a + b) == sin a * cos b + cos a * sin b
 • cos_add: ∀ a b : R, cos (a + b) == cos a * cos b - (sin a * sin b)
 • sin_neg: ∀ a : R, sin (- a) == - sin a
 • cos_neg: ∀ a : R, cos (- a) == cos a

Category (O)

ops: cat_id : ∀ x : O, x ~> x, comp (◦) : ∀ x y z : O, y ~> z → x ~> y → x ~> z
 • hom_equivalence: ∀ x y : O, Equivalence (@equ (x ~> y) (hom_equ x y))

```

• comp_proper:  $\forall x y z : 0, \text{Proper } (\text{equ} \implies \text{equ} \implies \text{equ}) \text{ (@comp 0 hom comp x y z)}$ 
• is_left_identity:  $\forall x y : 0, \text{LeftIdentity } (y \rightsquigarrow y) (x \rightsquigarrow y) \text{ (@comp 0 hom comp x y y) cat\_id}$ 
• is_right_identity:  $\forall x y : 0, \text{RightIdentity } (x \rightsquigarrow x) (x \rightsquigarrow y) \text{ (@comp 0 hom comp x x y) cat\_id}$ 
• comp_assoc:  $\forall (w x y z : 0) (f : y \rightsquigarrow z) (g : x \rightsquigarrow y) (h : w \rightsquigarrow x), f \circ (g \circ h) == (f \circ g) \circ h$ 

Functor (C D) over Category C, Category D
ops: fmap :  $\forall x y : C, x \rightsquigarrow y \rightarrow F x \rightsquigarrow F y, F : C \rightarrow D$ 
• fmap_proper:  $\forall x y : C, \text{Proper } (\text{equ} \implies \text{equ}) \text{ (@fmap C D \_ \_ F fmap x y)}$ 
• fmap_id:  $\forall x : C, \text{fmap } (F := F) (\text{cat\_id } (x := x)) == \text{cat\_id}$

Algebra (F A) over Field F extends VectorSpace, Ring

ops: `zero` (0) : A, `add` (+) : A → A → A, `neg` (- x) : A → A, `one` (1) : A, `mult` (*) : A → A → A, `scale` (*:) : F → A → A

- `smul_mul_assoc`: $\forall (a : F) (x y : A), (a * x) * y == a * (x * y)$
- `mul_smul_comm`: $\forall (a : F) (x y : A), x * (a * y) == a * (x * y)$

GeometricAlgebra (F V A) over InnerProductSpace F V extends Linear

ops: `vec` : V → A

- `vec_sq`: $\forall u : V, \text{vec } u * \text{vec } u == \langle u, u \rangle * 1$

GradeInvolution (F V A) over GeometricAlgebra F V A

ops: `involute` : A → A

- `involute_proper`: Proper (equ ==> equ) (@involute A involute)
- `involute_additive`: $\forall x y : A, \text{involute } (x + y) == \text{involute } x + \text{involute } y$
- `involute_multiplicative`: $\forall x y : A, \text{involute } (x * y) == \text{involute } x * \text{involute } y$
- `involute_homogeneous`: $\forall (a : F) (x : A), \text{involute } (a * x) == a * \text{involute } x$
- `involute_one`: `involute` (1 : A) == 1
- `involute_involute`: $\forall x : A, \text{involute } (\text{involute } x) == x$
- `involute_vec`: $\forall u : V, \text{involute } (\text{vec } u) == - \text{vec } u$

Limits (F N V) over VectorSpace F V, NatOrder N

ops: `tendsto` : (N → V) → V → Type, `cauchy` : (N → V) → Type

- `tendsto_proper`: $\forall (u u' : N \rightarrow V) (l l' : V), (\forall n : N, u n == u' n) \rightarrow l == l' \rightarrow \text{tendsto } u l \rightarrow \text{tendsto } u' l'$
- `tendsto_unique`: $\forall (u : N \rightarrow V) (l l' : V), \text{tendsto } u l \rightarrow \text{tendsto } u l' \rightarrow l == l'$
- `tendsto_const`: $\forall c : V, \text{tendsto } (\lambda _ \rightarrow c) c$
- `tendsto_add`: $\forall (u v : N \rightarrow V) (l m : V), \text{tendsto } u l \rightarrow \text{tendsto } v m \rightarrow \text{tendsto } (\lambda n \rightarrow u n + v n) (l + m)$
- `tendsto_neg`: $\forall (u : N \rightarrow V) (l : V), \text{tendsto } u l \rightarrow \text{tendsto } (\lambda n \rightarrow - u n) (- l)$
- `tendsto_smul`: $\forall (a : F) (u : N \rightarrow V) (l : V), \text{tendsto } u l \rightarrow \text{tendsto } (\lambda n \rightarrow a * u n) (a * l)$
- `tendsto_tail`: $\forall (u : N \rightarrow V) (l : V), \text{tendsto } u l \rightarrow \text{tendsto } (\lambda n \rightarrow u (\text{succ } n)) l$
- `cauchy_proper`: $\forall u u' : N \rightarrow V, (\forall n : N, u n == u' n) \rightarrow \text{cauchy } u \rightarrow \text{cauchy } u'$
- `cauchy_of_tendsto`: $\forall (u : N \rightarrow V) (l : V), \text{tendsto } u l \rightarrow \text{cauchy } u$
- `cauchy_add`: $\forall u v : N \rightarrow V, \text{cauchy } u \rightarrow \text{cauchy } v \rightarrow \text{cauchy } (\lambda n \rightarrow u n + v n)$
- `cauchy_neg`: $\forall u : N \rightarrow V, \text{cauchy } u \rightarrow \text{cauchy } (\lambda n \rightarrow - u n)$
- `cauchy_smul`: $\forall (a : F) (u : N \rightarrow V), \text{cauchy } u \rightarrow \text{cauchy } (\lambda n \rightarrow a * u n)$
- `cauchy_tail`: $\forall u : N \rightarrow V, \text{cauchy } u \rightarrow \text{cauchy } (\lambda n \rightarrow u (\text{succ } n))$

Complete (F N V) over Limits F N V

ops: `lim` : $\forall u : N \rightarrow V, \text{cauchy } 0 u \rightarrow V$

- `lim_tendsto`: $\forall (u : N \rightarrow V) (Hu : \text{cauchy } u), \text{tendsto } u (\text{lim } u Hu)$

Archimedean (F N) over OrderedField F, NatOrder N

ops: `of_nat` : N → F

- `of_nat_proper`: Proper (equ ==> equ) of_nat
- `of_nat_zero`: `of_nat` 0 == 0
- `of_nat_succ`: $\forall n : N, \text{of_nat } (\text{succ } n) == \text{of_nat } n + 1$
- `archimedean`: $\forall q : F, \{n : N \mid q < \text{of_nat } n\}$

Complex (F C) over Algebra F C, Commutative C C mult

ops: `imaginary` : C, `re` : C → F, `im` : C → F

- `i_sq`: `(imaginary : C) * imaginary` == - (1 : C)
- `re_proper`: Proper (equ ==> equ) (@re F C re)
- `im_proper`: Proper (equ ==> equ) (@im F C im)
- `re_additive`: $\forall x y : C, \text{re } (x + y) == \text{re } x + \text{re } y$
- `im_additive`: $\forall x y : C, \text{im } (x + y) == \text{im } x + \text{im } y$
- `re_homogeneous`: $\forall (a : F) (x : C), \text{re } (a * x) == a * \text{re } x$
- `im_homogeneous`: $\forall (a : F) (x : C), \text{im } (a * x) == a * \text{im } x$
- `re_one`: `re` (1 : C) == (1 : F)
- `im_one`: `im` (1 : C) == (0 : F)
- `re_i`: `re` (imaginary : C) == (0 : F)
- `im_i`: `im` (imaginary : C) == (1 : F)
- `re_im`: $\forall z : C, z == \text{re } z * 1 + \text{im } z * \text{imaginary}$

Frame (F V A I N) over GradeInvolution F V A, Finite I N

ops: `top` : A → F, `basis` : I → V

- `char_not_two`: (1 + 1 : F) != 0
- `basis_proper`: Proper (equ ==> equ) basis
- `top_proper`: Proper (equ ==> equ) (@top F A top)
- `top_additive`: $\forall x y : A, \text{top } (x + y) == \text{top } x + \text{top } y$
- `top_homogeneous`: $\forall (a : F) (x : A), \text{top } (a * x) == a * \text{top } x$
- `top_pseudoscalar`: `top` (natrec A 1 ($\lambda k \text{ acc} \Rightarrow \text{inv } (1 + 1) * (\text{acc} * \text{vec } (\text{basis } (\text{elem } k)) + \text{vec } (\text{basis } (\text{elem } k)) * \text{involute acc})$) card) == 1

Upd (I V)

ops: `upd` : (I → V) → I → V → I → V

- $\text{upd_at} : \forall (vs : I \rightarrow V) (i : I) (x : V) (j : I), j == i \rightarrow \text{upd } vs \ i \ x \ j == x$
- $\text{upd_off} : \forall (vs : I \rightarrow V) (i : I) (x : V) (j : I), j \neq i \rightarrow \text{upd } vs \ i \ x \ j == vs \ j$
